It currently consists of 4 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

consistency invention relates to a novel method for high throughput screening systems used to identify compounds for the treatment of cellular proliferation disorders. Specifically, it refers to candidate agents that are appale of modulating the activity of target proteins having motor compains, such that the target protein directly or indirectly produces ADP or phosphate. Furthermore, this activity can be determined using considerable that identifies modulators of the target protein, which is a method that identifies modulators of the target protein, which is a considerable immunomodulators and antiinflammatories. Accordingly, through gene therapy, they can be used for the treatment of cancer, hyperplasias, cardiants hypertrophy, immune disorders and inflammation. This polymucleotide sequence is human KID DNA (SeqID 5) encoding a full length can be uncention.
                                                                                                                                                                                                                                                                                                                                                            ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to human microtubule motor proteins and the nucleic acids encoding them. The invention also relates to a method of screening for modulators of a motor protein which has microtubule stimulated ATPase activity, a method of testing for ATPase activity of microtubule motor

```
This invention relates to a novel method for high throughput screening systems used to identify compounds for the treatment of cellular proliferation disorders. Specifically, it refers to candidate agents that are capable of modulating the activity of target proteins having motor domains, such that the target protein directly or indirectly produces ADP or phosphate. Furthermore, this activity can be determined using

                                                                                                                                                                                                                                                                                                                                                             proteins, methods to identify candidate agents that bind to a target protein or act as a modulator of the binding characteristics or biological activity of a target protein, modulators of the target protein, and methods of treating callular proliferation disorders such as cancer, hyperplasias, restenosis, cardiac hypertrophy, immune disorders and inflammation, for treating disorders associated with kinesin-like DNA binding protein (KID) and for inhibiting KID. The sequences are used for screening for modulators of motor proteins useful for treating callular proliferation disorders such as cancer, hyperplasias, restenosis, cardiac hypertrophy, immune disorders and inflammation, for treating disorders associated with KID and for inhibiting KID and for treating autoimmune chiseased, arthritis, graft rejection, inflammatory bowel disease and proliferation induced after medical procedures including surgery and angioplasty. This sequence represents DNA encoding a human microtubule motor protein of the invention.

fluorescence or absorbance readouts. The present invention describes a method that identifies modulators of the target protein, which is a kinesin-like DNA binding protein (known as KID) as cytostatic, cardiants, immunomodulators and antiinflammatories. Accordingly, through gene therapy, they can be used for the treatment of cancer, hyperplasis, treatenosis, cardiach hypertrophy, immune disorders and inflammation. This polynucleotide sequence is human KID DNA (SeqID 7) encoding a full length KID enzyme of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        099

                                                                                                               The invention relates to human microtubule motor proteins and the nucleic acids encoding them. The invention also relates to a method of screening for modulators of a motor protein which has microtubule stimulated Arpase activity, a method of testing for Arpase activity of microtubule motor proteins, methods to identify candidate agents that bind to a target protein, and as a modulator of the binding characteristics or biological activity of a target protein, modulators of the target protein, and methods of treating cellular proliferation disorders such as cancer, hyperplasia, restenosis, cardiac hypertrophy, immune disorders and inflammation, for treating disorders associated with kinesin-like DNA binding protein (KID) and for inhibiting KID. The sequences are used for

```
This invention relates to a novel method for high throughput screening systems used to identify compounds for the treatment of cellular proliferation disorders. Specifically, it refers to candidate agents that are capable of modulating the activity of target proteins having motor domains, such that the target protein directly or indirectly produces ADP or phosphate. Furthermore, this activity can be determined using fluorescence or absorbance readouts. The present invention describes a method that identifies modulators of the target protein, which is a kinesin-like DNA binding protein (known as KID) as cytostatic, cardiants, immunomodulators and antiinflammatories. Accordingly, through gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     /product= "KID protein"

The invention relates to human microtubule motor proteins and the nucleic acids encoding them. The invention also relates to a method of screening cardial encoding them. The invention also relates to a method of screening for Appase activity of microtubule scimulated Arpase activity, a method of testing for Appase activity of microtubule motor proteins, methods to identify candidate agents that bind to a target correction or act as a machilator of the binding characteristics or biological activity of a target protein, modulators of the target protein, and methods of treating cellular proliferation disorders such as cancer, hyperplasias, restences; cardiac hypertrophy, immune disorders and inflammation, for treating disorders associated with kinesin-like DNA binding protein (KID) and for inhibiting KID. The sequences are used for screening for modulators of motor proteins useful for treating cellular proliferation disorders such as cancer, hyperplasias, restencist, cardiac hypertrophy, immune disorders and inflammation, for treating disorders associated with KID and for inhibiting KID and for treating disorders associated with KID and for inhibiting KID on for treating disorders associated with KID and for inhibiting KID and for treating disorders associated with KID and for inhibiting KID and for treating disorders associated with KID and for inhibiting KID and for treating disorders associated with KID and for inhibiting KID and for treating disorders associated with KID and for inhibiting KID and for treating disorders associated with KID and for inhibiting KID and for treating disorders associated with KID and for inhibiting KID and for treating autoimmune conjugated after medical procedures including surgery and profile applace on order provention. Note: The specification states that this sequence encodes the protein featured as SEO ID NO:2, but this does not appear to be the case.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention relates to a novel method for high throughput screening systems used to identify compounds for the treatment of cellular proliferation disorders. Specifically, it refers to candidate agents that are capable of modulating the activity of target proteins having motor domains, such that the target protein directly or indirectly produces ADP or phosphate. Furthermore, this activity can be determined using fluorescence or absorbance readouts. The present invention describes a method that identifies modulators of the target protein, which is a kinesin-like DNA binding protein (known as KID) as cytostatic, cardiants, immunomodulators and antiliflammatoriies. Accordingly, through gene therapy, they can be used for the treatment of cancer, hyperplasias, restenosis, cardiac hypertrophy, immune disorders and inflammation. This polymucleotide sequence is human KID DNA (SeqID 3) encoding a full length
                                                                                                                                                                                                                                                                                                                                                               1. .1538

The invention relates to human microtubule motor proteins and the nucleic acids encoding them. The invention also relates to a method of screening for Arpase activity of microtubule atimulated Arpase activity, a method of testing for Arpase activity of microtubule motor proteins, methods to identify candidate agents that bind to a target protein or act as a modulator of the binding characteristics or biological activity of a target protein, modulators of the target protein, and methods of treating cellular proliferation disorders such as cancer, hyperplasias, restenoisis, cardiac hypertrophy, immune disorders and inflammation, for treating disorders associated with kinesin-like DNA binding protein (KID) and for inhibiting KID. The sequences are used for screening for modulators of motor proteins useful for treating cellular proliferation disorders such as cancer, hyperplasias, restenois, cardiac hypertrophy, immune disorders and inflammation, for treating disorders continent and for inhibiting KID and for treating disorders are used for associated with KID and for inhibiting KID and for treating cellular proliferation disorders and inflammation, for treating disorders continent associated with KID and for inhibiting KID and for treating autoimmune disorders and inflammation, for treating disorders continents associated with KID and for inhibiting KID and for treating autoimmune disorders are medical procedures including surgery and proliferation induced after medical procedures including surgery and construct protein of the invention. Note: The sequence resconders that this does not care protein of the protein featured as SEQ ID NO:4, but this does not appear to be the

The present invention describes a method for modulating the expression of a thanatos (death)-associated protein (THAP) responsive gene. The method comprises modulating the interaction of a THAP-family polypeptide or its biological fragment with a nucleic acid, and so enhancing or repressing the expression of the THAP responsive gene. Also described: (1) a method of composition of modulating the expression of a gene responsive a THAP-foremoxine complex; (2) a pharmaceutical carrier; (3) a transcription factor decoy element in a pharmaceutical carrier; (3) a transcription factor decoy consisting assentially of a THAP responsive element in a pharmaceutical carrier; (3) a transcription factor decoy described above; (5) methods of consisting essentially of a THAP-family polypeptide or its biological fragment, or a nucleic acid and a THAP-family polypeptide or its biological fragment, or a nucleic acid encoding a THAP-family polypeptide; (8) a method of constructing a cell which expresses a cell comprising a viral vector which comprises a promoter operably linked to a nucleic acid encoding a THAP-family polypeptide; (9) methods of identifying a test compound that modulates transcription from sesociated with a condition mediated by a THAP/chemokine complex of a chemokine element or that modulated by a THAP/chemokine complex or insufficient apoptosis, cardiovascular disease and neurodegenerative associated with a condition selected from excessive or insufficient apoptosis, cardiovascular disease and neurodegenerative or insufficient apoptosis, cardiovascular disease and neurodegenerative mediated by a THAP-family polypeptide in an individual; (1) a wector comprising a detectable product; (12) a genetically engineered cell acconding a detectable product; (12) a genetically engineered cell condition a that expression or condition to that expresses a THAP-family polypeptide in an individual; (12) a genetically by a that expression or that expresses a THAP-family polypeptide in an individual; (13) a condition and that expr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Modulating expression of a Thanatos (death)-Associated Protein (THAP) responsive gene for preventing or treating e.g. cancer or inflammation, comprises modulating the interaction of a THAP polypeptide with a nucleic

Novel human kinase gene #15.

(first entry)

06-MAY-2004 ADK40995;

ô polypeptide or its biological fragment; (13) an in vitro transcription reaction comprising a nucleic acid comprising a THAP responsive promoter, ribonucleotides and an RNA polymerase; and (14) an isolated mutant THAP-family polypeptide that does not bind to a chemokine. The pharmaceutical composition has antiangiogenic, antiinflammatory, cardiovascular, cytostatic, neuroprotective and osteopathic activities, and can be used as a THAP and THAP synthesis modulator. The composition can be used for modulating the expression of a THAP responsive gene. Modulation us useful for reducing symptoms of conditions such as excessive or insufficient angiogenesis, inflammation, metastasis of a cancerous tissue, excessive or insufficient apoptosis, cardiovascular disease or neurodegenerative present invention. 339 399 363 279 243 303 459 423 159 123 183 63 GGTCGCTGTCGGCTAAGCAAGATTGGAGCTACTCGTCGTCCACCTCCAGCTCGCGTAAGG 340 GGTTCAGTGCAGCCCATCCTAAGGCACTTGCTGGAAGGGCAGAATGCCAGTGTGCTTGCC GGTCGCTGTCGGCTAAGCAAGATTGGAGCTACTCGTCGTCCACCTCCAGCTCGCGTAAGG GTGGCTGTGCGACTGCGCCATTTGTGGATGGAACAGCGGGGGCAAGTGATCCCCCCTGT GTGCGGGGCATGGACAGCTGCTCTCTAGAGATTGCTAACTGGAGGAACCACCAGGAGACT GTGCGGGGCATGGACCAGCTGCTCTAGAGATTGCTAACTGGAGGAACCACCAGGAGACT CTCAAATACCAGTTTGATGCCTTCTATGGGGAGAGGAGTACTCAGCAGGACATCTATGCA CTCAAATACCAGTTTGATGCCTTCTATGGGGAGGGAGTACTCAGCAGGACATCTATGCA GGTTCAGTGCAGCCCATCCTAAGGCACTTGCTGGAAGGGCAGAATGCCAGTGTGCTTGCC TATGGACCCACAGGAGCTGGGAAGACGCACACAATGCTGGGCAGCCCAGAGCAACCTGGG GTGATCCCGCGGGCTCTCATGGACCTCCTGCAGCTCAAGGGAGGAGGGTGCCGAGGGC Gaps Query Match

The invention elates to novel isolated, enriched or purified nucleic acid molecules encoding a kinase polypeptide. The nucleic acid molecule comprises a sequence that: (a) encodes a kinase polypeptide; (b) is a complement of (a); (c) hybridizes under stringent conditions to (a) and encodes a naturally occurring kinase polypeptide; (d) encodes the polypeptide in (a), except that it lacks one or more, but not all, of an N-terminal domain, C-terminal catalytic domain, a catalytic domain, a spacer region and a C-terminal domain, a coiled-coil structure region, a spacer region and a C-New isolated, enriched or purified nucleic acid molecule encoding a kinase polypeptide, useful for treating cancer, immune-related diseases, cardiovascular disease, brain or neuronal-associated diseases and cytostatic; immunomodulator; cardiant; neuroprotective; nootropic; antiparkinsonian; virucide; antibacterial; fungicide; ophthalmological; analgesic; hypotensive; immunosuppressive; kinase inhibitor; kinase; cancer; peripheral nervous system; central nervous system; Alzheimer's disease; Parkinson's disease; multiple sclerosis; amyotrophic lateral sclerosis; viral infection; prion infection; ocular disease; migraine; pain; sexual dysfunction; mood disorder; attention disorder; pain; sexual dysfunction; mod disorder; psychotic disorder; neurological disorder; dyskinesia; metabolic disorder; organ transplant rejection; enzyme; gene; ds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAF15566 to AAF16505 encode the human prostate cancer associated proteins, called prostate cancer antigens, given in AAB56363 to AAB57302. The prostate cancer antigens can have neuroprotective, cytostatic, cardioactive, immunomodulatory, muscular, vulnerary, gastrointestinal, nephrotropic, antiinfective, gynaecological and antibacterial activities, and can be used in gene therapy. The prostate cancer antigen polymucleotides may be used for detection of prostate cancer, chromosome identification, as chromosome markers, and for numerous other diagnostic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              or research purposes. The prostate cancer antigens may be used to treat disorders such as neural, immune, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal, and proliferative

The invention relates to an isolated polynucleotide comprising any one of 38043 cDNA sequences, appearing as ACH12789-ACH50831, whose sequence was determined by the technique of SBH (sequencing by hybridisation). Also included is a purified polypeptide comprising a sequence corresponding to a reading frame of the novel polynucleotide. The nucleic acid sequences are useful in diagnostics as expressed sequence tags (EST) for certain from a sequence acid sequences in forensics, in assessing biodiversities, or in identifying mutations cresponsible for genetic disorders and other traits. The nucleotide correspondences are also useful as hybridisation probes, as oligomers for PCR, for chromosome and gene mapping, in the recombinant production of protein, or in generating antisense DNA or RNA. The purified polypeptide is useful for generating antisense DNA or RNA. The purified polypeptide for generating antisense DNA or RNA. The present sequence for this patent did not form part of the printed specification, but was conclusion contains an expension of the printed specification, but was conclusion contains an expension of the printed specification, but was conclusion contains an expension of the printed specification, but was conclusions and directly from USPTO at

expression, comprising any of the 27,400 fully defined nucleotide
sequences in the specification, or their complements or fragments, and
cenceding at least 8 amino acids of any of the 6888 amino acid sequences
fully defined in the specification. The probe is a single exon probe that
cerversesed in human cells or tissues. Also included are a spatially-
addressable set of single exon nucleic acid probes for measuring human
cells or tissues. Also included are a spatially-
addressable set of single exon nucleic acid probes for measuring human
cent addressably isolatable or amplifiable from the plurality), a single
comparay for measuring human gene expression, a method of
measuring human gene expression, a vector comprising the single exon
cerver amino acids of any of the above-mentioned amino acid
contiguous amino acids of any of the above-mentioned amino acid
sequences (optionally with conservative amino acid substitutions), an
contiguous amino acids of any of the above-mentioned amino acid
sequences (optionally with conservative amino acid substitutions),
contiguous amino acids of any of the above mentioned of providing
contiguous amino acids of any of the above methods of selling and/or licensing single exon probes or microarrays to
a customer dealing to measure gene expression, a method of providing
chuman gene expression data by subscription, and a computer-readable
correct including data on the expression of a single exon probe
cited above. The probe, methods and apparatus are useful in gene
cypression analysis. The probes may be used as tools for surveying
clied above. The probes may be used as tools for surveying
clied above of an constructing genome-derived single exon microarrays.
Considered the presence of expressed messages that contain their
specific exon, or in constructing genome-derived single exon microarrays.

The probes are used in identifying and characterising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        alternative splicing events, in detecting and characterising gross atterations in the genomic locus that includes their exon, in assessing smaller genomic alterations, in priming the synthesis of nucleic acids, or in expressing the ORF-encoded peptide. The present sequence is a human single exon probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       744 GATTGACTTGGCTGGGTCAGAGACAACCGGCGCACAGGCCAACAAGGGCCTTCGGCTAAA 803
